

HDI Predictor Project - Brainstorming & Ideation

Prepared for the SmartBridge internship submission.

Project Title: HDI Predictor Web Application

Problem Statement: Many users and students struggle to understand how health, education, and income factors contribute to a country's Human Development Index. Traditional methods are often static and do not provide instant predictive insights.

Proposed Solution: Build a Flask-based web application that predicts HDI scores from four indicators and classifies them into Low, Medium, High, and Very High tiers.

Target Audience: Students, researchers, educators, and policymakers interested in development analytics.

Technology Stack: Python, Flask, Pandas, NumPy, Scikit-learn, Seaborn, Matplotlib, HTML/CSS.
